

CORVET ACADEMY

On 28th July 2023, we have officially launched Corvet Academy primarily aimed at providing comprehensive training on machines delivered and those we will deliver together with our principals.

Having operators and supervisors who are sufficiently skillful is a challenge commonly faced in the industry. Even when they are well trained already, there is possible staff turnover.

Presentation during the launch

Corvet Academy training programmes, as value added service to our customers, will hence be able to help reskill and upskill the existing and new production & technical staff. We will provide training to educate them on basic working principles of the machines and related processes. Modules will include guidance on operations, maintenance, troubleshooting and solving process and quality issues. These all will help fulfil your productivity and quality targets from your machinery.

The training will be available on demand. Our trainers are well versed in local languages and thus be able to educate the personnel more effectively both in the classroom and during practical demonstrations. Modules can also be tailored to your needs upon request so that different emphases or additional topics can be added. The relevant training could certainly supplement as refreshers long after the normal

training conducted by the foreign suppliers' engineers during commissioning of new machines.

We will be ready to offer the training for solventless lamination technology and rotogravure printing technology very soon. More on other technologies will be rolled out in the coming months and next year.

Please stay tuned, also on other plans of the Academy in the pipeline.
